

# Storefront Final in PHP, Javascript, HTML, CSS.

Created by: Eduardo Murillo

Project for 23SPR-CIS-17B-48004.

**Admin email: ADMIN22**

**Admin name: ADMIN**

**Admin password: Password1234**

How to start: Load the storefront code into your local netbeans and load in also into MYSQL the included database to store the data from the users their email, name, password, and later on also store their order to the database.

How to use the store: Login into the page by giving your email, name, and password then the store will popup where you can place orders, once you have selected items from the store you will be sent to your cart and where you will prompt to enter your address and general info for shipping ("This will also be the part to where you will place the payment info but i don't do this"), and finally your order will be placed and it will send you to the main page.

Admin: for the admin actions you will be able to view orders, delete them, view items that are in the store, add items, and view user info.

All the code was mainly written in php due to the fact that all the data is stored in the database such as the images, the names of items, and prices.

All if these are stored on the database with formatting the helps me pick it apparent to do more functions on it, i used 3 different tables in the database the user db that stores there info, the items db that stores all the items in there formats, and the a orders table that stores all the data of the orders.
