Mancala in PHP, Javascript, HTML, CSS.

Created by. Eduardo Murillo.

Admin Email: ADMIN@.
Admin initials: AD
Admin Password:ADMIN1234

How to start: Load the mancala game into you local netbeans and load in also into MYSQL the included database to able to store the data from the users like there initials for the game functionality, there email, there password, and there points that they scored when they finish the game.

How to play:
To start playing you will need 2 players to login on to the main page by pressing the plus button located on both sides of the board, then you can start playing the game like a normal mancala one player at the time.
Once one side of the board is clear as in set all to 0 the game will end and the points earned will be stored in the localhost database.

Admin, will be able to view all the users info with their corresponding data like there initials, email, password, and there points they earned in the same page the admin will be able to edit and delete the users information to their will.

I used mainly html for the front end of the game such as the game board ant the user login page, i used php to store all the info of the user, and finally i used javascript to do all the users interactions with the game such as the movement the points, etc.
Also used cookies to store users info to later store it in the database with php.
